Wetter regions lean towards VPD dominance; mean soil moisture leads the attribution.

SHAP attribution of the dominance index D (VPD minus soil-moisture relative importance). XGBoost, test R^2 = 0.23, n = 1,761 cells at 2.5°.

Predictor groups

VPD 45.8% | Soil moisture 54.2%

Each segment is one predictor; lengths sum to 100% of mean |SHAP|.

Cell-level effects

Bar: median and 25–75% of all cells

Line: 5–95% of all cells

Dots: random 5% of cells (n = 88)

Dot shade

Low — High predictor value

Response shape

Line: LOWESS fit

Band: local 25–75%

Each row line is SHAP = 0; rows share the scale at the top right.
